

My Internship at MINI MECA

Presentation of the company :

The company is a French company called MINI MECA they conceive essentially lots of pieces for planes. Located at Carrière-sous-Poissy, they have one secretary, five employees and the manager called Stéphane Boutant.

Turnovers (sales) by year of MINI MECA :

955423\$ (US)

During my work placement :

I have made many things in the mechanic field and I have asked lots of questions to my mentor about mechanic , machining , manufacturing and others... I have practiced in the workshop , helped all the employees for their tasks every day and they were generally proud of me and my work.

I've worked with all the conventional type machine drilling machine, mill machine ,turning machine. I have worked with lots of precision tools like , micrometer (palmer), optic tools...

I've looked much at many technical drawings sent by other companies during the internship because MINI MECA is just a subcontractor and worked as a subcontractor for DASSAULT , PRECILEC, SAGEM an others and creates or modifies lots of pieces for them.

Schedule and relationship :

In general the schedule was good . I started the internship at seven thirty am and finished him at three pm and sometimes more than three pm because I wanted to stay to end my work , at twelve noon it was the time to eat and take a break . The relationship between the work team and me was pretty good , we worked like a team . Employees were funny ,serious in their work , and strong in good at their job and I was very impressed by their tasks and sometimes I've brought them knowledge in their work of my on free will because I like mechanics and I like to conceive a piece for plane. The condition in my internship was good , without anything special to add. I was not paid after my internship and I was very disappointed by this. I wish I was paid after my internship , but any law said a company is not bound to pay the trainee, that's it.
